

## Role of Magnetic Resonance Spectroscopy in Differentiating Neoplastic From Non-Neoplastic Ring Enhancing Brain Lesions Taking Surgical Findings as Gold Standard

Ameet Jesrani, Marya Hameed, Seema Nayab, Asma Javed, Sehrish Sethar

### ABSTRACT

**Objective:** To evaluate the diagnostic accuracy of Magnetic Resonance spectroscopy (MRS) in distinguishing neoplastic from non-neoplastic ring enhancing brain lesions taking histopathological findings as gold standard.

**Study Design and Setting:** The cross sectional study was conducted at Radiology department of Jinnah Postgraduate Medical Centre.

**Methodology:** Total 102 patients with ring enhancing lesions detected on MRI brain contrast studies were selected for this study. Cases were referred from Outpatient Department of Neurology Clinics who were suspected of having space occupying lesions in brain. Full history, clinical examination and laboratory investigations (Complete Blood Count and ESR) were carried out. The patients having claustrophobia, metallic implants, cardiac pacemaker and having metallic foreign body in situ were excluded from the study. Informed consent was taken from the research and MRS was performed. On MRS, lesion was categorized and final diagnosis was taken based on histopathology results. All the information was recorded into predesigned proforma. Patients Data was scrutinized by using Statistical Package for Social Sciences (SPSS 21.0). Mean + SD was calculated for age, gender, duration of symptoms and size of the lesion.

**Results:** The average age of the patients was 35.45±10.36 years. Sensitivity, specificity, PPV, NPV and accuracy of MRS was 87.5%, 93.3%, 95.5%, 89.7% and 92.1% respectively.

**Conclusion:** Magnetic resonance spectroscopy can be effective in discerning neoplastic from non-neoplastic ring enhancing cerebral lesions, thus avoiding an invasive procedure like brain biopsy.

**Key Words:** Brain lesions, Magnetic resonance spectroscopy, Neoplastic, Non-neoplastic, Ring Enhancing.

### INTRODUCTION:

Magnetic resonance spectroscopy (MRS) is an application of MRI that early detects the abnormal chemical metabolites of brain tissue.<sup>1</sup> First clinically used in 1980s, it has proved to be useful in providing molecular information about the tumor and non tumoral cells of the brain tissue.<sup>2</sup> After true

detection of the benign or malignant lesions on MRS, many patients are saved from undergoing unnecessary surgeries.

Ring-enhancing lesions are frequently encountered neurological lesions and provide a challenge to neuroimaging. Typical location of ring-enhancing lesions is at the junction of the gray and white matter, however they can also be seen in the sub-cortical area, deep in the brain parenchyma or may even be superficial.<sup>3</sup> Cerebral ring-enhancing lesions may present as non-tumorous conditions like abscesses, tuberculomas, multiple sclerosis, resolving hematoma (age 10-21days) or even post radiation necrosis. These conditions can easily mimic primary brain tumors or metastasis.<sup>4</sup>

Some of non neoplastic lesions show changes in MRS like raised Cho/Cr ratio with a suppressed NAA peak in Alexander's leukodystrophy<sup>5</sup> while lower concentration of all metabolites, except Cr, in adult onset autosomal dominant leukodystrophy. Gupta R et al<sup>6</sup> described the presence of lipid/lactate peak in both pyogenic and tuberculous abscesses, however, more frequently in tuberculous lesions. Distinguishing neoplastic from non-neoplastic ring-enhancing and tumor mimicking lesions is extremely important which if misdiagnosed may not only lead to unwarranted neuro-

surgery, noxious chemotherapy or harmful irradiations but also prove to be fatal in many cases. Conventional MRI shows only 61.4%<sup>7</sup> sensitivity in separating benign from malignant lesions even with the use of exceptional soft tissue contrast.

Magnetic resonance spectroscopy (MRS) significantly increases the diagnostic accuracy when used as an adjunct with conventional MRI. MRS determines the concentration of specific metabolites of different neurological pathologies in a pre-selected volume of brain tissue.<sup>8,9</sup> Therefore, in newer imaging, MRS is emerging as a capable diagnostic tool in identifying several neurological and neurosurgical disorders with sensitivity and specificity of 97.6%<sup>1</sup> and 71.42%<sup>10</sup> respectively.

The rationale of this study was the intention to determine the diagnostic accuracy of magnetic resonance spectroscopy which is cost effective, noninvasive and does not involve ionizing radiations in detecting neoplastic from non-neoplastic ring enhancing brain lesions and to standardize its use to determine the best management.

#### METHODOLOGY:

This cross-sectional study was executed from 9<sup>th</sup> January 2019 till 10<sup>th</sup> July 2019 in Radiology department of Jinnah Postgraduate Medical Centre after approval from ethical committee. Total 102 patients with ring enhancing lesions detected on MRI brain contrast studies were selected with patient's age ranging from 16 to 70 years. The mean age was 35.45±10.36 years of both genders. Cases were referred from Outpatient Department of Neurology Clinics who were suspected of having space occupying lesions in brain. Full history, clinical examination and laboratory investigations (Complete Blood Count and ESR) were carried out.

The patients having claustrophobia, metallic implants, cardiac pacemaker and having metallic foreign body in situ were excluded from the study. Informed consent was taken from the research and ethical committee of the institution. Sample size was calculated considering both the sensitivity and specificity of magnetic resonance spectroscopy to differentiate neoplastic from non neoplastic ring enhancing brain lesions. Nonprobability consecutive sampling technique was applied to collect the samples. Patient's history regarding duration of symptoms and demographic details like patient's age and gender was noted. Patients were subjected to Toshiba 1.5 Tesla MR Scanner. Various sequences were carried out with and without contrast like T1, T2 and Fluid Attenuated Inversion Recovery using a head coil. Then MRS was performed via single voxel technique using main metabolites like NAA which appears at 2.01ppm, Cho at 3.22ppm, Cr at 3.02, lipid at 0.8 to 1.3ppm and lactate at 1.32 to 1.33ppm.

Lesions with increased Choline and reduced NAA levels along with increased Cho/Cr ratio of more than 1.5 were labelled as neoplastic. While non-neoplastic lesions have reduced Cho, Cr and NAA levels.<sup>2</sup> Final results were

evaluated based on the histopathology results.

Statistical analysis was performed by using Statistical Package for Social Sciences (SPSS 21.0) as to obtain sensitivity and specificity of MRS in the differentiation of neoplastic from non-neoplastic ring enhancing brain lesions while taking histopathology as gold standard. Frequency and percentage was calculated for qualitative variables, i.e. presenting complains, detailed history of presenting complains; MRS findings and histopathological findings.

Mean ± SD was computed for quantitative variable, i.e. Age of the patient. Taken histopathological results as gold standard, all statistical parameters, (sensitivity, specificity, positive predictive value, negative predictive value) were estimated to obtain diagnostic accuracy of MRS.

Patients Data was scrutinized by using Statistical Package for Social Sciences (SPSS 21.0). Mean + SD was calculated for age, duration of symptoms and size of the lesion. Frequency and percentage was computed for qualitative variables like gender, benign and malignant ring enhancing cerebral lesions using MRS and histopathology. With histopathology findings as gold standard; the sensitivity, specificity, positive predictive value, negative predictive value and diagnostic accuracy of magnetic resonance spectroscopy findings were calculated using 2 x 2 tables. Stratification was done on age, gender, duration of symptoms and size of the lesion.

#### RESULTS:

A total of 102 patients with ring enhancing lesions detected on MRI brain contrast studies were included in this study. There were 60.78% (62/51) male and 39.22% (40/51) female. Diagnostic precision of magnetic resonance spectroscopy in separating neoplastic from non-neoplastic ring enhancing brain lesions is presented in table 1. Sensitivity, specificity, PPV, NPV and accuracy of MRS was 87.5%, 93.3%, 95.5%, 89.7% and 92.1% respectively.

#### DISCUSSION:

Magnetic resonance spectroscopy provides useful chemical

**Table 1:** Diagnostic accuracy of MRS in segregating neoplastic from non-neoplastic ring enhancing brain lesions taking histopathology as gold standard

Magnetic Resonance spectroscopy Findings	Histopathology		Total
	Positive	Negative	
Neoplastic	42 (TP)	2 (FP)	44(43.1%)
Non neoplastic	6 (FN)	52 (TN)	58(56.9%)
<b>Total</b>	<b>48(47.1%)</b>	<b>54(52.9%)</b>	<b>102</b>
Sensitivity	87.5%		
Specificity	93.3%		
PPV	95.5%		
NPV	89.7%		
Accuracy	92.1%		

Figure 1(b): MRS of lesion in right parietal lobe shows elevated choline peak and reduced NAA peak

Figure 2(a): Ring enhancing lesion in left parietoccipital lobes with perilesional edema

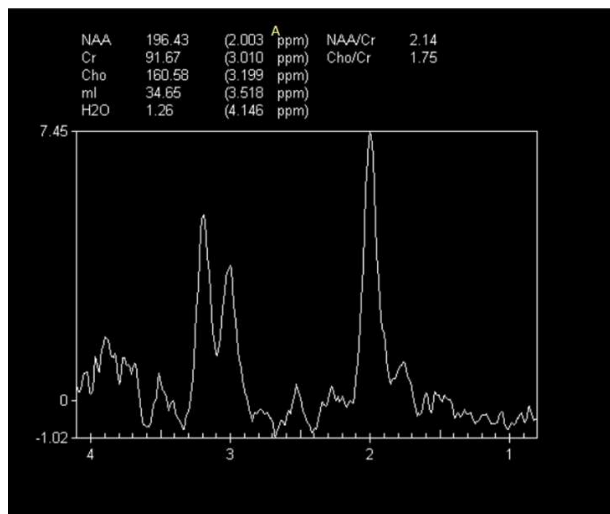

Figure 2(b): MRS of lesion in left parietoccipital lobes shows elevated lipid/lactate peak

showed diagnostic accuracy of 83% while our study revealed the diagnostic accuracy of 92.1% which signifies present study more. MRS is helpful for categorizing and classifying brain tumors. <sup>23</sup> Gliomas of each grade exhibit some specific

MRS features which again improve the diagnostic value of conventional magnetic resonance imaging.<sup>24</sup>

Few limitations apply to this study. First, this study was conducted in one center of a private hospital and, hence, a certain demographics variables were observed. Second, sample size was small hence more sample size is required to generalize the specific findings and results.

**CONCLUSION:**

By using non invasive technique of MRI like MRS, invasive procedures such as brain biopsy can be avoided in differentiating neoplastic from non neoplastic ring enhancing brain lesions thus reducing the morbidity and mortality.
